## A Homer Detective Book Review

Energy conservation and efficient distributed energy systems: A white paper by Deloitte Solutions. The key energy conservation and efficient distributed energy system (DESS) market drivers are an aging and expanding population, increasing competition for power in new markets with high levels of distributed generation and increasing regulatory burdens. To mitigate these risks, companies are exploring new business models for the co-generation of electricity and heating to meet their customers' power and heating demands in smarter ways. Our 2013 white paper titled "Key Energy Conservation and Efficient Distributed Energy System (DESS) Market Drivers: An Overview" examines the energy conservation and efficient DESS market opportunities and challenges. The report can be downloaded at: Heat transport by the fluid phase-conductive heat transfer. Material Works Process 7. Energy Production. Types of heat transfer Efficient heat transfer can be classified in three broad categories (based on the heat transfer processes): – Conductive heat transfer (heat conduction), – Mixing heat transfer (convection), and – Radiation heat transfer. These processes depend on the properties of the heat transfer medium, the temperature of the medium, and the heat generated or removed by the body or process, respectively. .
